

MIGRATING DATA BETWEEN STORAGE VOLUMES

ABSTRACT

5 Provided are a method, system, and program for migrating data between storage
volumes. A source map is provided indicating blocks of data striped across a first
plurality of storage units and a destination map is provided indicating blocks of data
striped across a second plurality of storage units, wherein data is migrated from stripes
indicated in the source map to corresponding stripes indicated in the destination map. In
response to determining that the source stripe and the destination stripe occupy a same
10 physical location on the storage units, the data from a source stripe is written to a copy
area and writing the data from the copy area to a corresponding destination stripe.
